## Chemistry 225 Semester 04-2016 Homework for Submission \#3

Answer the following questions and submit them for marking as instructed. Only answers showing full working can attract full marks. Express your answers to the correct number of significant figures. Submissions showing evidence of copying will attract zero marks.
NB. It would be worthwhile to complete this homework before the midterm exam. Students may ask for advice after any class.

1) Write equilibrium expressions in the form " $K=$ " in each of the following cases:
a) $5 \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{MnO}_{4}^{-}(\mathrm{aq})+8 \mathrm{H}^{+}(\mathrm{aq}) \rightleftharpoons 4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Mn}^{2+}(\mathrm{aq})+5 \mathrm{Fe}^{3+}(\mathrm{aq})$
b) $\mathrm{Fe}_{3} \mathrm{O}_{4}(\mathrm{~s})+4 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})+3 \mathrm{Fe}(\mathrm{s})$
c) $2 \mathrm{Fe}(\mathrm{s})+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+14 \mathrm{H}^{+}(\mathrm{aq}) \rightleftharpoons 2 \mathrm{Fe}^{3+}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
d) $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l}) \rightleftharpoons \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{g})$
2) Hydrogen iodide and iodine are introduced into a sealed vessel at a temperature at which iodine, hydrogen and hydrogen iodide are gases, and reaction is allowed to take place until an equilibrium mixture of hydrogen iodide, iodine and hydrogen is reached at this same temperature. Sketch:
a) a graph of concentration against time showing the concentrations of hydrogen, iodine and hydrogen iodide.
b) a second graph showing both the rate of destruction of hydrogen iodide (one curve) and the rate of its production (a second curve) as a function of time. Use the same pair of axes for both these curves.
3) a) An equilibrium mixture contains 0.0200 mol of bromine, 0.0125 mol of hydrogen and 0.0005 mol of hydrogen bromide at a fixed temperature. Determine the equilibrium constants $\left(\mathrm{K}_{\mathrm{c}}\right)$ for the reactions represented by
i) $2 \mathrm{HBr}(\mathrm{g}) \rightleftharpoons \mathrm{H}_{2}(\mathrm{~g})+\mathrm{Br}_{2}(\mathrm{~g})$
ii) $\quad 1 / 2 \mathrm{H}_{2}(\mathrm{~g})+1 / 2 \mathrm{Br}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{HBr}(\mathrm{g})$
and determine the mathematical relationship between these constants.
Hint: let the volume of the container be $\mathrm{V} \mathrm{dm}{ }^{3}$.
b) In another experiment conducted at this same temperature, some HBr was admitted into an evacuated $2000 \mathrm{~cm}^{3}$ vessel and when equilibrium was attained some had decomposed yielding 6.32 mol of bromine as one product. What was the concentration of each species present at equilibrium?
4) A 0.831 g sample of $\mathrm{SO}_{3}$ is placed in a 1.00 L container and heated to 1100 K . The $\mathrm{SO}_{3}$ dissociates to $\mathrm{SO}_{2}$ and $\mathrm{O}_{2}$ according to the following equation:

$$
2 \mathrm{SO}_{3}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})
$$

At equilibrium the total pressure in the container is 1.300 atm . Find the value of $\mathrm{K}_{\mathrm{p}}$ for this equilibrium at 1100 K . (Hint: develop your ICE table in terms of partial pressures and recall the relationship between total pressure and partial pressures for a mixture.)
